Ig gamma-1 chain precursor (15C5) - mouse (fragment)
C;Species: Mus musculus (house mouse)
C;Species: Mus musculus (house mouse)
C;Accession: 614238
C;Accession: 614238
C;Accession: A.M.; Bulens, F.; Bernar, H.; Nelles, L.; Lijnen, R.H.; Collen, D.
A;Title: Construction and characterization of a recombinant murine monoclonal antibody d A;Reference number: $14236; MUID:91006173; PMID:2209622
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  C; Accession: S31913

-!- CATALYTIC ACTIVITY: L-arginine + H(2)0 = L-ornithine + urea.
-!- COPACTOR: Manganese.
-!- PATHWAY: Arginine degradation via the urea cycle; first step.
-!- SUBUNIT: Homotrimer.
-!- SUBUNIT: Homotrimer.
-!- INDUCTION: By arginine or homoarginine.
-!- SIMILARITY: Belongs to the arginase family.
                                                                                                                                                                                                                                                                                   Uchino T., Haraguchi Y., Aparicio J.M., Mizutani N., Higashikawa M., Naitoh H., Mori M., Matsuda I.;

- CATALYTIC ACTIVITY: L-arginine + H(2)0 = L-ornithine + urea.

- CATALYTIC ACTIVITY: L-arginine + H(2)0 = L-ornithine + urea.

- SUBUNIT: Homographer.

- SUBUNIT: Homographer.

- SUBUNIT: BOCATION: Cytoplasmic.

- SUBULILLAR LOCATION: Cytoplasmic.

- INDUCTION: By arginine or homographine.

- SIMILARITY: Belongs to the arginase family.

-!- CATALYTIC ACTIVITY: L-arginine + H(2)O = L-ornithine + urea. COFACTOR: Manganese.
-!- PATHWAY: Arginine degradation via the urea cycle; first step..-!- SUBUCELLULAR LOCATION: Cytoplasmic.'
-!- SUBCELLULAR LOCATION: Cytoplasmic.'
-!- SIMILARITY: Belongs to the arginase family.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ..

T. darginase II) and comparison of its induction with nitric oxide
T. darginase II) and comparison of its induction with nitric oxide
Synthase in a murine macrophage-like cell line.";
FEBS Lett. 395:119-122(1996).

-!- FUNCTION: May play a role in the regulation of extra-urea cycle
arginine metabolism and also in down-regulation of nitric oxide
Synthesis (By similarity).
-!- COFACTOR: Manganese.
-!- CATAUTY: L-arginine + H(2)O = L-ornithine + urea.
-!- COFACTOR: Manganese.
-!- PATHWAY: Arginine degradation via the urea cycle; first step.
-!- SUBCELLULAR LOCATION: Mitochondrial.
-!- SUBCELLULAR LOCATION: Mitochondrial.
-!- SUBCELLULAR LOCATION: Mitochondrial.
-!- SIMILARITY: Belongs to the arginase family.
                                                                                                                                                                                                                                                                  Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          arginase genes during amphibian metamorphosis.";
J. Biol. Chem. 269:25328-25334(1994).
-!-PUNCITON. As well as its role in the urea cycle, may be involved in tissue remodeling.
-!-CATALYTIC ACTIVITY: L-arginine + H(2)O = L-ornithine + urea.
-!-COFACTOR: Manganese (By similarity).
-!-PATHWAY: Arginine degradation; first step.
-!-SUBINIT: Homotrimer (By similarity).
-!-TISSUE SPECIFICITY: Expressed at differing tadpole stages in tail, integrine, hindlimb and trunk region. Most abundant in tadpole
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     DEVELOPMENTAL STAGE: First detected in neurula (stage 16/17). Highest levels in whole tadpole found around stage 47/48. In the lintestine, increased levels are found during metamorphosis (stage 58-64). Low levels expressed in hindlind until stage 66 after which, levels dramatically increase. In the tail, a constant high level of expression is found throughout metamorphosis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Xenopus laevis (African clawed frog).

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

A; Description: catalyzes ATP-driven formation of alanyl-D-alanine from 2 alanine molecul A; Description: catalyzes ATP-driven formation of alanyl-D-alanine molecul A; Pathway: cell wall synthesis A; Mote: two D-alanine-D-alanine ligases in E. coli (and S. typhimurium) encoded by two cthe two enzymes display remarkably similar catalytic efficiencies and substrate specific C; Superfamily: D-alanine-D-alanine ligase
C; Superfamily: D-alanine-D-alanine ligase motif 2
F; 245-276/Region: D-alanine-D-alanine ligase motif 2
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         RESULT 10

AG0518
C. Calanine ligase B [imported] - Salmonella enterica subsp. enterica serovar Ty
C;Species: Salmonella enterica subsp. enterica serovar Typhi
A;Note: this species has also been called Salmonella typhi
C;Date: 09-Nov-2001 #sequence_revision 09-Nov-2001 #text_change 18-Nov-2002
C;Accession: AG0518
